Finding Grid Id for a point

---

$(x, y)$

$(100, 100)$ 

$(0, 100)$

$(100, 100)$

$(0, 0)$

$(100, 0)$

Find ( 20, 60 ) ? ? ?

↓  
110 ★

Find ( 45, 90 ) → 110

Find ( 66, 20 ) → 105

Find ( 80, 78 ) → 108 ☺

# Quad Tree

BUILD

# GOOGLE MAPS API

Step 1: Tabulate all places of interest

Place Id	Place Type	Title	Description	Lat	Long	leaf cell-id
----------	------------	-------	-------------	-----	------	--------------

Step 2: Initialize a Quad Tree ☺

Leaf Cell Id	$T_L$	$T_R$	$B_L$	$B_R$
--------------	-------	-------	-------	-------

hm 1

4 pts

grid cell id →

hm 2:  
cell →

4 children cell ids

hm 3  
cell → point cell id

Step 3: Now support Queries

★ point  $(x,y)$  → Find many barber shops

① Find Cell Id for  $(x,y)$

→ A1080

② Places collection

→ All 100 places for that cell.

I

→ Filter  $\Rightarrow$  Barber shop

Rank Them

User 😊

II

Give you a few neighbouring  
cell ids as well.

① All places inside those cells  
eg. 6 neighbours  $\Rightarrow$  600 places

② Filtering

③ Ranking

→ User 😊

100M places of interest

10L x 100

10cr places of interest

7B people

Step 4:

How to handle a new establishment being created

890

Place (x, y)

Indian Restaurant

Saga Rata -

① Find leaf-cell-id [x, y] → A 2078

② Add 890 = Place Id in the Places collection

③ check if cellid = A 2078 > 100 places

No

> 100

A 2078 / divided into 4 new cells

A 9091

A 9092

A 9093

A 9094

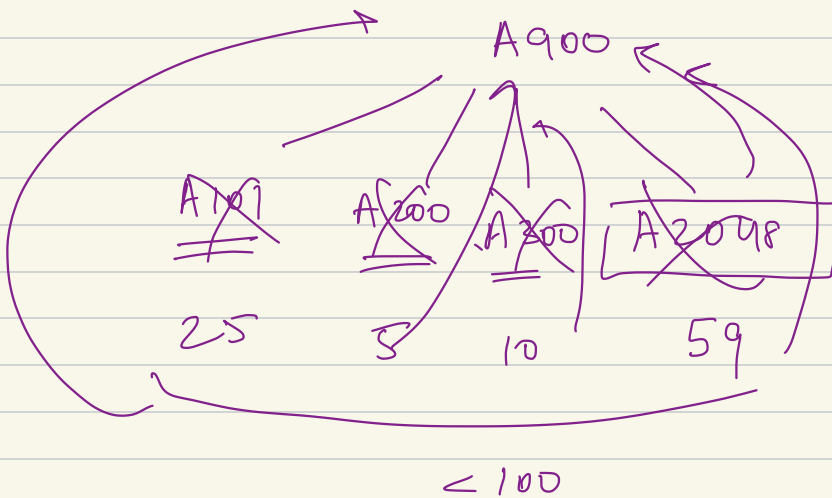

divided

101 places

Step 5: Remove an establishment. //

107 — A2048 X

A2048  $\rightarrow 60 - 1 = 59$

# Calculation

7B people

700M places

1 place: 10 people

70M places

1 place : 100 people

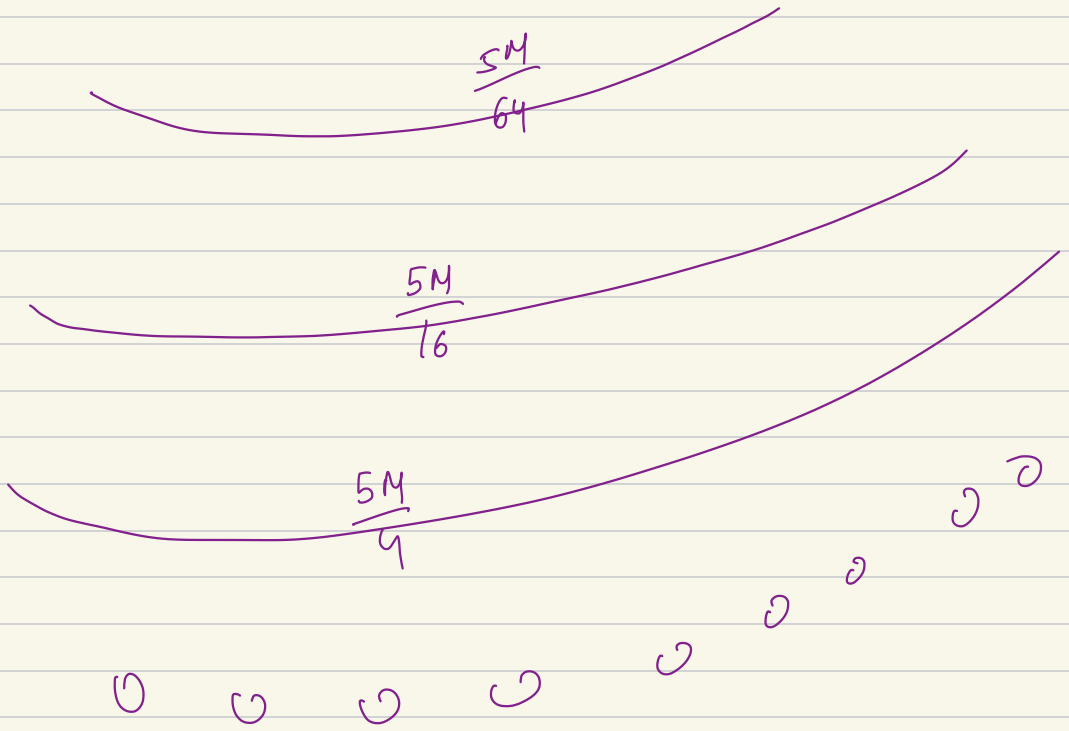

100M places of interest / world 😊

100M

$$\begin{aligned}\# \text{ Leaf Nodes} &= \frac{100 \text{ M}}{20} \\ &= 5 \text{ M} \quad \text{leaf nodes} \quad \text{😊}\end{aligned}$$

$$\text{Total \# Nodes in whole quad Tree} = 5M + \frac{5M}{4} + \frac{5M}{16} + \frac{5M}{64} + \frac{5M}{256} + \dots + 1$$

$$= 5M \left( 1 + \frac{1}{4} + \frac{1}{16} + \frac{1}{64} + \dots \right)$$

$$= 5M \times 1.33 \frac{1}{\frac{3}{4}} = \frac{4}{3}$$

# 6.5 M nodes

## STORAGE SPACE

100 M places

- ✓ Plau id → 8 B
- ✓ Titu → 50 B
- ✓ Deson → 8 B
- ✓ PlauType → 8 B
- ✓ Callid → 8 B

~~200 B~~ ~~100 B~~

100 M × 100 B

$10 \times 10^3 \times \text{MB}$

= ~~10 GB~~

20 GB

6.5 M nodes

× 200 Bytes

$13 \text{ M} \times 100 \text{ B}$

$1.3 \times 10^3 \times \text{MB}$

= 1.3 GB (⊖) (⊖)

Quad Tree - Nodes

6.5 M nodes

$8 \times 8 = \underline{\underline{64 \text{ Bytes}}}$

8 Bytes

40 Bytes

112 B

200 Bytes

21.3 GB

# Uber

100 M Places of Interest

Drivers  $\equiv$  Places of Interest

---

7 B

700 M drivers

1 driver : 10 people

70 M drivers

1 driver : 100 people

7 M drivers

1 driver : 1000 people

10 M Uber drivers / world.

Uber

To be a collection of independent

small  
Uber  
systems

Uber

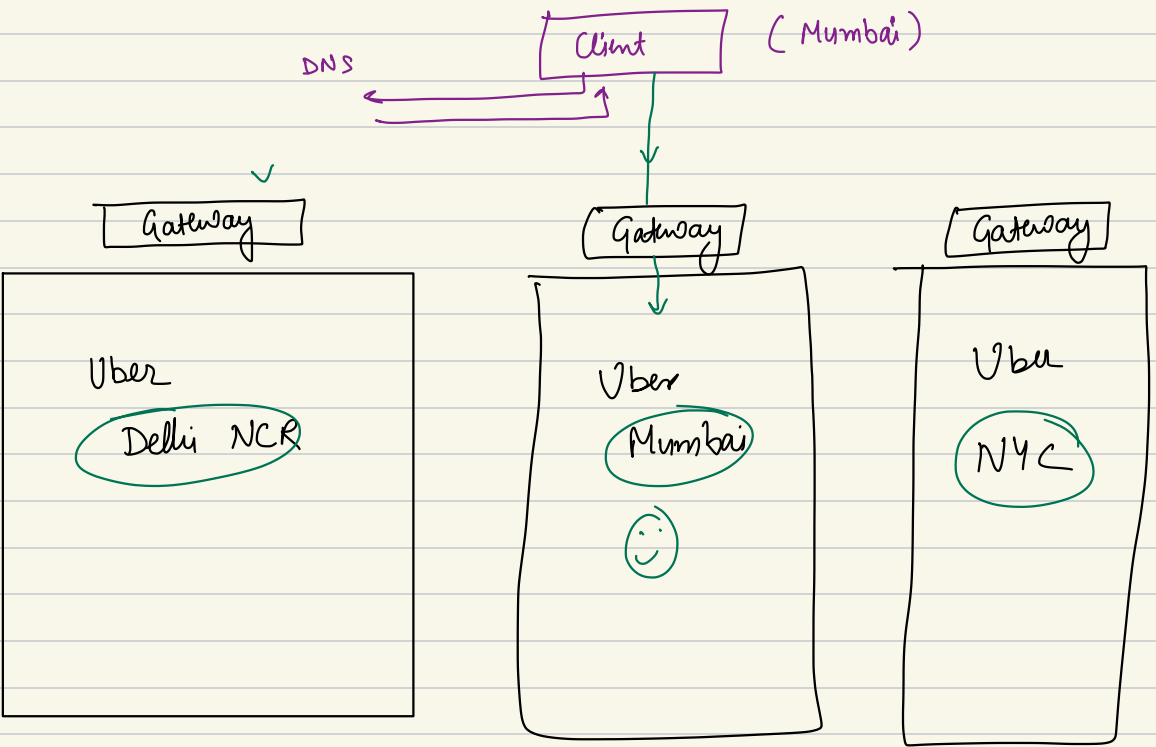

NYC

Uber

Delhi  
NCR

Uber

Mumbai  
+  
nearby

Zoom into any 1 city cluster

ex. Mumbai  
city cluster

500K drivers in Mumbai city  
clusters

How to initialize a quad Tree

given when all drivers keep on moving

Based on some parameter which

can be a good approximation

I) Initialized Quad Tree 😊

II) Every Uber driver based on their current location can be allocated to 1 quad tree leaf node.

Client driver

+ (driver-id, location)

Gateway

Global Cache

Quad Tree

+ update driver cell 😊

driver-id, latest driver location

<u>107</u>	<u>x<sub>1</sub>, y<sub>1</sub></u>
108	<u>x<sub>2</sub>, y<sub>2</sub></u>
=	

[ we don't split / merge with every driver cell update ]

Update my quad tree cell distribution

[cell merging + cell splitting]

once every 1-4 hours.

# Uber - Mumbai Cluster

Client

Quad Tree

Find Drives

cell-id

# Question

How to find neighbourhood cells

strategy 1

$[10, 40]$

$10, (60-1) \rightarrow (10, 59)$

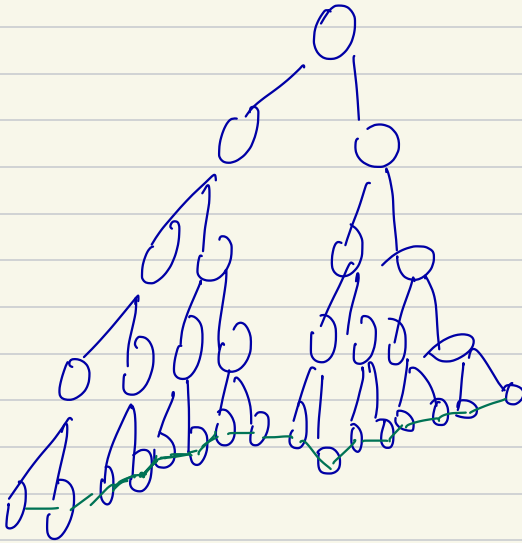

$0(-1, 40)$

Find  $(-1, 40)$

$\rightarrow$  B1079 😊

Find  $(10, 59) \rightarrow$  B7091  
😊

## Strategy 2

### Strategij 3

hm 1

cell-id  $\rightarrow$  location coordinates

hm 2

cell-id  $\rightarrow$  children cells

hm 3

cell-id  $\rightarrow$  parent-cell-id

hm 4

cell-id  $\rightarrow$  [ places ]

# Question

Drivers

→ update his everytime I get a new driver location

driver-id

details

location

leaf-cell-id

107

~~1094~~ C707  
=

location

[ leaf-cell-id ]

[ . ]

[ cell-id → Parent cell ids ]

[

once every 1-4 hours.

Question — how to merge leaf nodes

↓ extra removed (-)

evaluate the possibility of merging!?

$$11 + 60 + 20 + 8 = \underline{\underline{99}}$$

merge 😊

H9071 : // (new leaf node)

99

mid x =

mid y =

$x, y \Rightarrow \text{user}$

if ( $x > \text{mid } x$ )

{ if ( $y > \text{mid } y$ )
